

Electron Configuration (Section 5.2)

Dr. Walker

Objectives

- To determine the electron configuration of any of the first 38 elements of the periodic table
- To determine the identity of an element from its electron configuration
- To complete an orbital diagram using arrows to represent electrons

Where are Electrons?

- Electrons exist in different energy levels (previously described as “shells”)
- The energy levels correspond to the horizontal rows on the periodic table

Where are Electrons?

- **Orbitals** are areas within shells where the electrons are located
 - These orbitals may have different shapes
 - There may be different numbers of orbitals within a shell
- We know the electron is somewhere in the orbital, but we can't know exactly where it is or how fast it is moving
 - Heisenberg's Uncertainty Principle
- **Each orbital can hold two electrons (Pauli Exclusion Principle)**

(1) Pure Appl. Chem., 73, No. 4, 667-683 (2001)

Relative atomic mass is shown with five significant figures. For elements having no stable nuclides, the value enclosed in brackets indicates the mass number of the longest-lived isotope of the element.

However three such elements (Th, Pa, and U) do have a characteristic terrestrial isotopic composition, and for these an atomic weight is tabulated.

Learning Check

- What are orbitals?
- Where are orbitals?
- How many electrons reside in each orbital?

Learning Check

- What are orbitals? A place where electrons can be found
- Where are orbitals? Outside the nucleus
- How many electrons reside in each orbital? 2

Types of Orbitals (subshells)

- S orbitals – 1 orbital per shell – holds ____ electrons total
- P orbitals – 3 orbitals per shell – holds ____ electrons total
- D orbitals – 5 orbitals per shell – holds ____ electrons total
- F orbitals – 7 orbitals per shell – holds ____ electrons total

Types of Orbitals (subshells)

- S orbitals – 1 orbital per shell – holds **2** electrons total
- P orbitals – 3 orbitals per shell – holds **6** electrons total
- D orbitals – 5 orbitals per shell – holds **10** electrons total
- F orbitals – 7 orbitals per shell – holds **14** electrons total

d_{xy}

d_{xz}

d_{yz}

$d_{x^2-y^2}$

d_{z^2}

Electron Configuration

- Defined
 - Electron configuration is the arrangement of electrons around the nucleus of an atom based on their energy level.

Actual Electron Configurations

- Total electrons = atomic number
- Electrons are added one at a time to the lowest energy levels first (Aufbau principle)
- Fill energy levels with electrons until you run out
- A superscript states how many electrons are in each level

Order of Orbitals

- Low Energy to High Energy (# of electrons)
 - 1s (2)
 - 2s (2)
 - 2p (6)
 - 3s (2)
 - 3p (6)
 - 4s (2)
 - 3d (10)
 - 4 p (6)
 - 5s (2)
 - Continues for the whole periodic table
 - You're expected to know through here

Making Sense of the Order

Another option

- Draw the orbitals in this format, use diagonal lines to determine order of orbitals to fill

Actual Electron Configurations

- Total electrons = atomic number
- Fill energy levels with electrons until you run out
- A superscript states how many electrons are in each level
 - **Hydrogen – $1s^1$ – 1 electron total**
 - **Helium – $1s^2$ – 2 electrons total**
 - **Lithium – $1s^2 2s^1$ – 3 electrons total**
 - **Beryllium – $1s^2 2s^2$ – 4 electrons total**

Write all

Actual Electron Configurations

- Bigger Elements
 - Fill the energy levels until you run out of electrons
 - Oxygen
 - Sodium
 - Titanium

Actual Electron Configurations

- Bigger Elements
 - Fill the energy levels until you run out of electrons
 - Oxygen
 - $1s^2 2s^2 2p^4$
 - Sodium
 - $1s^2 2s^2 2p^6 3s^1$
 - Titanium
 - $1s^2 2s^2 2p^6 3s^2 3p^6 4s^2 3d^2$

Practice

- Potassium

Practice

- Potassium
 - Atomic Number = 19
 - $1s^2 2s^2 2p^6 3s^2 3p^6 4s^1$
 - Superscripts add up to atomic number

Shorthand

- Shorter form of electron configuration
- $[\text{Ne}] = 1s^2 2s^2 2p^6$
- $[\text{Ar}] = 1s^2 2s^2 2p^6 3s^2 3p^6$
- Potassium
 - Atomic Number = 19
 - $1s^2 2s^2 2p^6 3s^2 3p^6 4s^1$
 - $[\text{Ar}] 4s^1$

Pauli Exclusion Principle

- Two electrons in same orbital have different spins

Orbital Diagrams

□ *Orbital Diagrams*

...show spins of e^- and which orbital each is in

- Each electron is an arrow
- They have opposing “spins” – think of two bar magnets together
- Orbital diagrams are visual representations of electron configuration

Hund's Rule

- When electrons are filling orbitals of the same energy, they prefer to enter empty orbitals first. These electrons all have the same spin
- A diagram of nitrogen is shown below (7 total electrons)

Hund's Rule

- The orbital diagram below violates Hund's rule because the third electron does not enter the empty 2p orbital

Terms to Know & Skills to Master

- Terms
 - Orbitals
 - Hund's Rule
 - Aufbau principle
 - Pauli Exclusion principle
- Skills
 - Determining electron configuration from number of electrons
 - Determining the identity of an element from its electron configuration
 - Completing orbital diagrams using arrows to represent electrons
